

Correction to Oceanography Lab 2 – Problem 3D

There is a typo in the question, the answer key shows the correct location. The tower on Ship Island is located at the point where the dot sits above the “i” in the word “Ship” on Ship Island.

The question should read as follows:

(d) From Station 1, you set off on a course for the tower at Ship Island, when your ship sails into a fog bank. Using radar, the navigator determines you are 3.5 nautical miles away from Buoy A and 3.0 nautical miles from the tower at **Ship Island**. With a compass, locate your position off the harbor entrance and determine the actual course made good and the ship’s distance from Ship Island.
